L07: Hash Functions
May 25, 2004

MD5
SHA-1
HMAC

Message Digests

- Message Digests make a “fingerprint” of a file.
- Input: 1- 2^{64} bytes
- Output: 128 or 160* bits

Message Digests

Constitution of the United States of America
(In Convention, September 17, 1787)

Preamble

We the people of the United States, in order to form a more perfect union, establish justice, insure domestic tranquility, provide for the common defense, promote the general welfare, and secure the blessing of liberty to ourselves and our posterity, do ordain and establish the Constitution of the United States of America.

Article I.

Section 1. All legislative powers herein granted shall be vested in a Congress of the United States, which shall consist of a Senate and a House of Representatives.

...

Properties of a good Message Digest

$$\text{Digest} = f(\text{Input})$$

- Digest cannot be predicted from the input
- Hard or impossible to find two inputs with the same digest.
- Changing one bit of input changes ~50% of the output bits.

Message Digest Algorithms

- Rivest Functions:
 - MD2 (RFC 1319), MD4 (RFC 1320), MD5 (RFC 1321)
- NIST Functions:
 - SHA, SHA-1, SHA-512, SHA-1024
- Other Functions:
 - Snerfu, N-Hash, RIPE-MD, HAVAL

Comparing Message Digest Functions

Function	Bits	Comments
MD2	128	Slow Secure
MD5	128	Fast Reasonably Secure
SHA-1	160	Slow Secure
SHA-256	256	?
SHA-512	512	?
SHA-1024	1024	?

Message Digest Example

message	MD5(message)
“this is a test”	ff22941336956098 ae9a564289d1bf1b
“this is c test”	c5e530b91f5f324b 1e64d3ee7a21d573
“this is a test ”	6df4c47dba4b01cc f4b5e0d9a7b8d925

Key Points

- Any change in the input changes the digest:
 - Adding a space
 - Changing a line break
 - Capitalizing a word

“Breaking” a message digest

- Brute-force attack:
 - Search for two messages that have the same digest (they should be many of them)
 - Create a message with a desired message digest
- Algorithm attack
 - Using your knowledge of match, create two document with a given digest.

Documents with Tunable Digests

We the [redacted] of the [redacted], in order to [redacted] a more perfect union, establish justice, insure domestic tranquility, provide for the common defense, promote the general welfare, and secure the blessing of liberty to ourselves and our [redacted], do ordain and establish the Constitution of the United States of America.

4 choices = 2^4 different MD5 codes.

- Still a long way from 2^{128}
- Real problem is finding the match

Just how big is 2^{128} ?

$$2^{128} = 340,282,366,920,938,463,463,374,607,431,768,211,456$$

If you could try a billion² combinations a second, it would take 10,790 billion years

$$(2^{128} / 10^9 / 10^9 / (60*60*24*365) / 10^9)$$

Brute force attacks on smaller digests

# bits	example	Time to crack*
3	Check digit	0
8	Check character	0
16	CRC-16	0
32	CRC-32	71 minutes
40		12 days
58	DES MAC	2283 years

* Assuming 1 million tries per second
DES Cracker can do 88 billion keys per second;
with Distributed.NET it could cracking 245 billion keys per sec in 1999

MD5 vs. SHA-1

MD5	SHA-1
Designed by Ron Rivest	Designed by NIST/NSA
128 bit digest	160 bit digest
IETF standard	USG standard
3x faster than SHA-1	3x slower than MD5
May contain flaws	May contain flaws

I prefer MD5, but SHA-1 is “the standard.”

Uses of Digest Functions

- Integrity
 - verifying downloaded code
 - verifying SSL streams
- Authentication
 - verifying a shared secret w/o encryption
- Factoring
 - Use Digest to determine if two files are identical

MD5s for Downloaded Code

The ProFTPD Project: MD5 sums and PGP signatures of release files

MACs and HMACs

- MAC = “Message Authentication Code”
- HMAC = “Keyed Hashing for Message Authentication” (RFC 2104)
- <http://www.ietf.org/rfc/rfc2404.txt>
- <http://www.cs.ucsd.edu/users/mihir/papers/hmac.html>

MACs: The Big Idea

RFC 2104: HMAC

$$\text{HMAC}(f, K, M) = f(K \oplus 0x5c^{64} \cdot f(K \oplus 0x36^{64} \cdot M))$$

More complicated than concatenating the key and taking the hash, but more secure!

Uses of HMACs

- Data integrity and authentication
 - BGP uses HMAC
 - IPsec Authentication Header and Encapsulating Security Payload use HMAC as a digital “signature.”
- Password protocols

MD5 API: Perl

```
% man Digest::MD5
```

```
...
```

```
# Functional style
```

```
use Digest::MD5 qw(md5 md5_hex md5_base64);
```

```
$digest = md5($data);
```

```
$digest = md5_hex($data);
```

```
$digest = md5_base64($data);
```

```
# OO style
```

```
use Digest::MD5;
```

```
$ctx = Digest::MD5->new;
```

```
$ctx->add($data);
```

```
$ctx->addfile(*FILE);
```

```
$digest = $ctx->digest;
```

```
$digest = $ctx->hexdigest;
```

```
$digest = $ctx->b64digest;
```

MD5 HMAC API

NAME

Digest::HMAC_MD5 - Keyed-Hashing for Message Authentication

SYNOPSIS

```
# Functional style
```

```
use Digest::HMAC_MD5 qw(hmac_md5 hmac_md5_hex);
```

```
$digest = hmac_md5($data, $key);
```

```
print hmac_md5_hex($data, $key);
```

```
# OO style
```

```
use Digest::HMAC_MD5;
```

```
$hmac = Digest::HMAC_MD5->new($key);
```

```
$hmac->add($data);
```

```
$hmac->addfile(*FILE);
```

```
$digest = $hmac->digest;
```

```
$digest = $hmac->hexdigest;
```

```
$digest = $hmac->b64digest;
```

MD5 Representations

M-T^]M-^LM-YM-^O^@M-2^DM-iM-^@ M-^XM-IM-xB~

\$digest = \$ctx->digest;

\$digest = \$ctx->hexdigest; → 1B2M2Y8AsgTpgAmY7PhCfg

\$digest = \$ctx->b64digest;

8ddd8be4b179a529afa5f2ffae4b9858

Using the Perl API

```
#!/usr/bin/perl

use strict;
use Digest::MD5;

foreach $_ (@ARGV) {
    open(F, $_) || die "Cannot open $_, $!";
    my $ctx = Digest::MD5->new;
    $ctx->addfile(*F);
    print $_, "\t", $ctx->hexdigest, "\n";
}
```

OpenSSL C API

```
#include <openssl/md5.h>
```

```
unsigned char *MD5(const unsigned char *d,  
                  unsigned long n,  
                  unsigned char *md);
```

```
void MD5_Init(MD5_CTX *c);
```

```
void MD5_Update(MD5_CTX *c, const void *data,  
               unsigned long len);
```

```
void MD5_Final(unsigned char *md, MD5_CTX *c);
```

```
void MD5_Init(MD5_CTX *c);
```

- A Context is used for a process that needs to be repeated over many blocks of data
 - Stream cipher
 - Encryption of many blocks
 - Calculation of a message digest
- Similar to instance variables in object oriented programming.

The Context holds state between each block

```
void MD5_Init(MD5_CTX *c);
```

```
void MD5_Update(MD5_CTX *c, const void *data,  
unsigned long len);
```

```
void MD5_Final(unsigned char *md, MD5_CTX *c);
```

`char buf[]` vs.
`unsigned char buf[]`

- Technically, binary data should be `unsigned char`
- Many C routines take `char`
 - (e.g. `read()`, `write()`, etc.)
- Expect frequent casts or compiler warnings

Other uses of MACs

- Hash Trees
- S/KEY
- Password Challenge-Response
