

DS2500

3/14-Fri π Day!

Admin

- HW4 out, due 3/21 9pm
- Lab 4 monday

- proposal grades out!

↳ if ask for more info,
give response in regrade, or
email Larey

Agenda

1. NumPy + image generation
2. Real world data / viz
3. Python

→ cdzab
bit.ly/ds2500_gdrive

1. numpy 2nd image generation

↳ library that supports arrays, mathy computations

- similar to Python list, conceptually $\{ \sim, \sim, \sim \}$
- specializes in numbers
- compared to lists, arrays are smaller + faster

↳ primitives, contiguous memory

obj
5
~
~
~

prim
5

list
[8, 9, 10]
[]
[]

array
[8, 9, 10]
[]
[]

Numpy examples

→ import numpy as np

create array

ray = np.array([7, 8, 9])

ray2d = np.array([[7, 8, 9], [20, 22, 24]])

ray3d = np.array([[[1, 2], [3, 4]],
[[5, 6], [7, 8]]])

shape (type)

(3,)

(2, 3)

(2, 2, 2)

→

1, 2	3, 4
5, 6	7, 8

$\{\{1, 2, 3\}, \{4, 5, 6\}\},$
 $\{\{7, 8, 9\}, \{10, 11, 12\}\}$

(2, 2, 3)

$Z = \text{np.zeros}(3, 4)$

↗ shape

$\text{order} = \text{np.arange}(5)$

$[0, 1, 2, 3, 4]$

* diff size?

Numpy aiffs

- all same datatype
- same size in dimension
- $\text{np.mean}()$, $\text{np.std}()$, $\text{np.linalg}()$,
 $\text{np.median}()$, $\text{np.fft}()$

- loop shortcuts $\otimes$ $\text{ray1} + \text{ray2}$
↳ add indiv values,
create new ray

2. Real World Data (+viz)

↳ today: latlong.csv (48 states, has cap. locations)

goze: create image using numpy

Convert lat/long to positions in the grid

numpy grid

50, 50, 3 grid

row #: increases top to bottom

col #: increases left to right

given a lat/long,
compute row/col
need: border values

Continental US

grid in numpy

row 30

normalization: $\frac{x - \min}{\max - \min}$

longitude conversion

$$\frac{-71 - (-125)}{-65 - (-125)} = .9 \quad (.9)(150) = 135$$

latitude conversion:

$$\frac{42 - 25}{50 - 25} = .68 \quad 100 - (.68)(100) = 32$$
